AM26775AC-N Mouse IgG2a - APC

Quantity: 0.1 mg
Concentration: 0.1 mg/ml

Background: The specificity of staining by monoclonal antibodies to target antigens should be

verified by establishing the amount of non-specific antibody binding. Especially at higher concentration (more than 15 μ g/ml) the antibody staining usually has consignable background. To this end a non-reactive immunoglobulin of the same isotype is included as a negative control for each specific monoclonal antibody used in a particular immunoassay. The monoclonal antibody MOPC-173, generated against an undefined antigen, does not react specifically with mouse, rat and human samples, and hence all the background that could be observed when working with this antibody would be a result of general nonspecific interactions between an mouse $\lg G2a$ molecule and the respective sample under the particular conditions. This shall help the customer to set up the experimental conditions so that the nonspecific

binding of any antibody is abolished.

Host / Isotype: Mouse / IgG2a
Clone: MOPC-173
Immunogen: Mineral oil

Format: State: Liquid purified Ig fraction

Buffer System: Phosphate buffered saline (PBS)

Preservatives: 15 mM sodium azide

Stabilizers: 0.2% (w/v) high-grade protease free Bovine Serum Albumin (BSA) **Label:** APC – Conjugated with cross-linked Allophycocyanin (APC) under optimum

conditions. The conjugate is purified by size-exclusion chromatography.

Applications: The reagent is intended as isotype control for flow cytometry analysis to establish the

amount of non-specific antibody binding. For your particular experiment, use the same concentration of this isotype control antibody as the recommended working concentration of the antigen-specific antibody. Also, when working with prediluted

antibodies, dilute the isotype control to the same concentration as is the

concentration of the antigen-specific antibody in the prediluted antibody solution you are using. If under particular experimental conditions the background signal of the isotype control is too high (usually when working concentrations of used antibodies are above 10 µg per ml of incubation mixture), change the conditions of your

experiment to reduce the background.

Other applications not tested. Optimal dilutions are dependent on conditions and

should be determined by the user.

Specificity: This antibody reacts with an unknown epitope. It does not react with a variety of

resting, activated, live, and fixed mouse, rat and human tissues.

Species Reactivity: Tested: Negative on Human, Mouse, an Rat

AM26775AC-N: Mouse IgG2a - APC

Storage: Store the antibody at 2-8°C.

DO NOT FREEZE!

This product is photosensitive and should be protected from light.

Shelf life: one year from despatch.
