AM50161PU-N Monoclonal Antibody to Retinol Binding Protein / RBP - Purified

Quantity: 0.2 mg
Concentration: 0.2 mg/ml

Background: Retinol Binding Protein is a single-chain glycoprotein belonging to the superfamily of

hydrophobic molecule transporter proteins, which is responsible for the transport of Retinol (vitamin A1) from the liver to peripheral target tissues. RBP is synthesised by hepatic parenchymal cells where it becomes bound to its ligand retinol and is then released into the circulation, where it binds further to the protein transthyretin, to form a transporting complex. An increasing number of studies suggest that the subsequent release of retinol from RBP at the plasma membrane occurs through

interaction of RBP with specific membrane receptors.

Host / Isotype: Mouse / IgG1

Recommended Isotype

Controls:

SM10P (for use in human samples), SM20P (for use in rat samples), AM03095PU-N

Clone: SPM442

Immunogen: Human Retinol Binding Protein (RBP) purified from plasma.

Genename: RBP

Format: State: Liquid purified IgG fraction from Bioreactor Concentrate

Purification: Protein A/G Chromatography

Buffer System: 10mM PBS

Preservatives: 0.05% Sodium Azide

Stabilizers: 0.05% BSA

Applications: ELISA: Use BSA free Antibody for coating.

Immunofluorescence: 1-2 μg/ml. Western Blotting: 0.5-1 μg/ml.

Immunoprecipitation: 1-2 μ g/500 μ g protein lysate.

Immunohistochemistry on Frozen Sections: 1.-2 μg/ml for 30 minutes at RT.

Positive Control: Liver or placenta.

Other applications not tested. Optimal dilutions are dependent on conditions and

should be determined by the user.

Molecular Weight: 21-25kDa

AM50161PU-N: Monoclonal Antibody to Retinol Binding Protein / RBP - Purified

Specificity:

Recognizes a protein of 21kDa-25kDa, identified as retinol binding protein (RBP). Its

epitope localizes between aa 74-182 of Human RBP.

This Monoclonal Antibody recognizes reduced and carboxy-methylated RBP (RCM-RBP) as well as the circulatory RBP but not the native RBP, thereby suggesting that its

epitope becomes accessible either on unfolding or upon binding of RBP to transthyretin (prealbumin). RBP is responsible for distributing retinol from the retinoid stores in the liver to the various target tissues. Once secreted into the blood with bound retinol, the vitamin carrier circulates complexed with transthyretin prior to vitamin delivery at the plasma membrane through a receptor-mediated mechanism.

Cellular Localization: Cytoplasmic.

Species: Human, Monkey, Goat, Rabbit, Rat, and Mouse.

Other species not tested.

Storage: Store undiluted at 2-8°C.

Shelf life: one year from despatch.
