

Hepatitis C Virus NS3 - Purified

Catalog No.: AR10564PU-L

Quantity: 1 mg

Background: HCV is a small 50nm, enveloped, single-stranded, positive sense RNA virus in the family Flaviviridae.

HCV has a high rate of replication with approximately one trillion particles produced each day in an infected individual. Due to lack of proofreading by the HCV RNA polymerase, the HCV has an exceptionally high mutation rate, a factor that may help it elude the host's immune response. Hepatitis C virus is classified into six genotypes (1-6) with several subtypes within each genotype. The preponderance and distribution of HCV genotypes varies globally. Genotype is clinically important in determining potential response to interferon-based therapy and the required duration of such therapy. Genotypes 1 and 4 are less responsive to interferon-based treatment than are the other genotypes (2, 3, 5 and 6).

Source: E. coli

Format: **Purity:** >95% pure as determined by 10% PAGE (Coomassie staining).

Purification Method: S-Sepharose Ceramic Hydroxyapatite > Affinity Purification.

Buffer System: 50mM NaPO₄ pH 8.3, 8mM DTT

Applications: Antigen in ELISA and Western blots, excellent antigen for detection of HCV with minimal specificity problems.

Other applications not tested. Optimal dilutions are dependent on conditions and should be determined by the user.

Description: The *E. coli* derived recombinant contains the full length HCV NS3 (c33c) immunodominant regions. No fusion sequences. Six histidine tag.

Specificity: Immunoreactive with sera of HCV-infected individuals, including sera with antibodies to NS3 secondary structure domains.

Storage: Store undiluted at 2-8°C for one month or (in aliquots) at -20°C for longer.

Avoid repeated freezing and thawing.

Shelf life: one year from despatch.
